### DEFINITION OF TERMS

### AND ABBREVIATIONS

## DEFINITION OF TERMS AND ABBREVIATIONS

Abatement (mine drainage usage) - The lessening of pollution effects of mine drainage

AMD - Abbreviation of acid mine drainage

Anticline - A fold of rock beds that is convex upward

Background (water quality map) - The natural or normal concentration of a chemical in water

Bony- Rock that has a high carbon content--usually refers to the dark colored coal mining waste material

cfs - Abbreviation of cubic feet per second--a unit of fluid or gaseous flow

Coal structure contour - A contour line drawn through points of equal elevation on the coal bed or horizon, in order to depict the attitude of the rocks

Concentration (water quality usage) - The amount of a substance occurring in a given amount of water-common units are parts per million (ppm) or milligrams per liter (mg/l)

Deep mine - An underground mine

Dip - The angle at which a plane (usually a rock bedding plane) is inclined from the horizontal. The dip direction is defined as at right angle to the strike in the downward direction

Downcutting - Process of stream channel erosion

Drift - A deep mine entry driven directly into a horizontal or near horizontal coal seam or vein when it outcrops or is exposed at the ground surface

EPA - Abbreviation for Environmental Protection Agency

Evapo-transpiration - A collective term meaning the loss of water to the atmosphere from both evaporation and transpiration by vegetation

Fold axis - A line drawn on a rock stratum at the point of intersection of the axial plane (which is a plane passing through the trough of a syncline or the peak of an anticline)

Grab sample - Samples of point source pollution. For example, deep mine discharges, seepage from spoil piles, coal refuse, or a combination of the above

Head (of water) - Water pressure expressed as the feet of elevation difference between the top of the water and the point at which the pressure is existed

Ibs/day - Abbreviation of pounds per day--used in water quality as the unit for the amount of material carried by flowing water

Load (water quality usage) - The quantity of material carried by flowing water--generally expressed as pounds per day

MDD - Abbreviation for Mine Development Drawing

mg/l - Abbreviation of milligrams per liter, which is a weight to volume ratio commonly used in water quality analysis. It expresses the weight in milligrams of a substance occurring in one liter of water. Several substances are commonly expressed as the equivalent weight of another substance, such as acidity and hardness, which are expressed as equivalent weights of calcium carbonate

Modular sample - A sample of drainage from a small watershed unit. These samples were useful in differentiating between polluted and non-polluted regions of a watershed

Monthly sample - A periodic sampling of drainage from an upstream portion of the mainstream, or a major tributary of the mainstream. These samples were used primarily to ascertain and then monitor known pollution areas

pH - The negative logarithm to the base ten of the hydrogen ion concentration (expressed in moles per liter) in solution

Paleoenvironment - The environment of an area at some specified time in the distant past

Permeability - The degree of capability of a rock to allow the flow of water. The higher the permeability, the greater the flow of water at any given pressure.

Regime - A reach of stream which has a regular pattern of water quality, usually either highly acid or mildly acid

Shaft - A near vertical mine entrance

Slope - An inclined (but not vertical) mine entryway driven from the land surface down to the seam

Stratigraphy - The science of formation, composition, sequence and correlation of stratified rocks

Strike - The direction of a horizontal line on the plane that is tangent to the surface of a stratum at the point of measurement

Strip mining - Mining method whereby the overlying materials are removed to expose the mineral for extraction

Structure contour - A line drawn through all points of equal elevation on an inclined strata

Syncline - A fold of rock beds that is convex downward

Tap-off - A discharge mechanism (generally a bore hole) used to regulate mine pool elevation

Tipple - Structure above a mine shaft, particularly a coal mine, in which loaded mine cars are emptied by being tipped over

Transpiration - The normal loss of water vapor to the atmosphere from plants

WPA - Abbreviation for the Works Progress Administration

Weir - A wooden flow measuring structure with a V notch that is inserted in a stream channel to cause water to flow through the V notch. The height of the water in the V notch is convertible to a flow volume

Wrench Fault - A strike-slip fault whose plane is nearly vertical and the movement along which was basically horizontal
